Microscale bioprocess optimisation.

Publication Date: 2006 Dec PMID: 17084609 Authors: Micheletti, M. - Lye, G. J. Journal: Curr Opin Biotechnol Microscale processing techniques offer the potential to speed up the delivery of new drugs to the market, reducing development costs and increasing patient benefit. These techniques have application across both the chemical and biopharmaceutical sectors. The approach involves the study of individual bioprocess operations at the microlitre scale using either microwell or microfluidic formats. In both cases the aim is to generate quantitative bioprocess information early on, so as to inform bioprocess design and speed translation to the manufacturing scale. Automation can enhance experimental throughput and will facilitate the parallel evaluation of competing biocatalyst and process options. post to: CiteULike http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=PubMed&dopt=Abstract&list_uids=17084609

Emerging concepts in molecular MRI.

Publication Date: 2006 Nov 23 PMID: 17126545 Authors: Sosnovik, D. E. - Weissleder, R. Journal: Curr Opin Biotechnol Molecular magnetic resonance imaging (MRI) offers the potential to image some events at the cellular and subcellular level and many significant advances have recently been witnessed in this field. The introduction of targeted MR contrast agents has enabled the imaging of sparsely expressed biological targets in vivo. Furthermore, high-throughput screens of nanoparticle libraries have identified nanoparticles that act as novel contrast agents and which can be targeted with enhanced diagnostic specificity and range. Another class of magnetic nanoparticles have also been designed to image dynamic events; these act as 'switches' and could be used in vitro, and potentially in vivo, as biosensors. Other specialized MR probes have been developed to image enzyme activity in vivo. Lastly, the use of chemical exchange and off-resonance techniques have been developed, adding another dimension to the broad capabilities of molecular MRI and offering the potential of multispectral imaging. These and other advances in molecular MRI offer great promise for the future and have significant potential for clinical translation. post to: CiteULike http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=PubMed&dopt=Abstract&list_uids=17126545

How VoIP Works -- Busting Out

How VoIP Works -- Busting Out of Long Distance Rates
Author: Lucy P. Roberts

;

VoIP is the newest advancement in audio communications technology, and has a variety of different applications that make it useful. VoIP stands for Voice over Internet Protocol, and how VoIP works is actually quite revolutionary because it streamlines the process of sending analog audio signals by converting them to a much easier to send digital form for transmission. To understand how VoIP works, you'll need to understand the basic concept behind regular analog audio communication as well, since this is the precursor for VoIP. Analog phone calls are actually made via fiber optic networks by digitizing your voice communications for sending the signal across thousands of miles, but once it gets to the final destination (a home or office phone, for instance), the signal is once again converted to analog. During these calls, the

switches remain open even while there is dead air and no conversation is taking place; the circuit is also open in both directions even when only one party is talking and the other is listening. This isn't terribly efficient, and slows down the communication of information considerably. Packet switching streamlines VoIP. VoIP works on a different premise -- rather than circuit switching, data packet switching sends and receives information only when you need it instead of in a constant stream. It also sends the information packets along whatever open channels are available rather than a dedicated line, which is much more efficient. The information is simply reassembled at the source. The payload of each packet has a destination coded into it determining the ultimate destination. When the computer at the other end receives all of these packets, it will reassemble the information into useable form. This form of sending audio data is extremely efficient because it always takes the cheapest route that is also the least congested. The compression of information and use of multiple routes in order to send that information over the most efficient route makes sending audio over packet switching quicker, much less expensive and more efficient. The number of calls that can be sent is orders of magnitude higher than it was with the more traditional analog circuit switching systems. For companies, the savings in long distance charges can be in the hundreds or even thousands of dollars per year. If companies also make extensive conference calls, VoIP makes even more sense when combined with conferencing options such as document sharing in systems offered by companies like Voxwire and iVocalize. Different types of VoIP calling are available. The most commonly used VoIP system is from one computer to another. To set up this type of service, you will need to have a sound card installed in both computers along with microphones and Internet connections. For practical purposes, you'll want a broadband connection or DSL -- a dial-up modem will be so slow the sound quality just won't be that good. Aside from that, all you need is a software package that can set you up with everything you need to use VoIP to make phone calls to whomever is also set up with the same system. You can also invest in IP phones if you want something that looks just like your standard analog telephones but with VoIP connectability. These simply replace the old-style RJ-11 connectors with Ethernet connectors (RJ-45). Hardware such as routers and the needed software are built right in. Analog telephone adaptors (ATA) enable you to connect a standard telephone to your computer Internet connection in order to take advantage of VoIP options. ATA converts analog signals to digital so that it can be transmitted properly via the Internet. The newest option on the market is the Wi-Fi phone, which uses short-distance Internet transmission of VoIP to replace cell phones calls. Wi-Fi broadcasts over the radio spectrum to cover short range areas for users in certain areas, and these "hot spots" have popped up across the U.S. The upshot of VoIP is that standard long-distance charges may soon become a thing of the past. As more and more consumers turn on to VoIP and broadband connections make it easy and inexpensive (as well as practical) to make phone calls over the Internet, fewer individuals will be willing to pay high rates to make a telephone call they can make for free or next to nothing via their computer. VoIP saves you money on long distance. There's no by-the-minute charges with VoIP, no set-up fees, and no "time of day" or overages. That's the great thing about VoIP plans. You just pay a monthly fee and get to make all the calls you want over your computer for one monthly fee. It's so simple and elegant, and it's the solution that everyone's been wanting and waiting for far too long. You don't have to wait for a certain time of day of day of the week to make telephone calls with VoIP. There's also the advantage of being able to use your VoIP connection from anywhere -- remember, you're not tied to a phone jack to use your number, but an Internet connection, so you can call from anywhere with many calling plans. Some of the companies that offer excellent VoIP plans with unlimited calling are listed below with their most popular options: Vonage currently offers a \$24.95 per month unlimited VoIP package to anywhere in the U.S. or Canada. It includes voicemail, call forwarding, three way calling, call waiting and caller ID. Packet 8 can provide unlimited VoIP for \$19.95 a month in the U.S. and Canada with a variety of features like call waiting and three-way calling, and can also give you video phone service for about \$29.95 per month. AT&T's CallVantage provides the usual U.S. and Canada broadband calling with voicemail, call waiting, etc. along with email, a call log and a 'do not disturb' option, all for \$29.99 a month. You also get to keep your phone number for life, no matter where you go -- a great feature for some who move around a lot. VoIP in web conferencing packages VoIP is used in almost all web conferencing services as an alternative to standard conference calls, and looking into these packages will give you an idea of some ways to combine VoIP with extras such as white boards, document sharing and video. For less expensive options, many companies can provide strictly audio VoIP conference calls combined with text messaging and document sharing without video. Some companies that offer VoIP in web

conferencing packages separate from video conferencing are: Voxwire offers voice communication with features like auto-queue, mute options, individual speaker adjustments and moderator controls along with a "follow me" browser system so that all participants can view a shared desktop. Two persons can use VoIP for \$9.95 a month, or up to ten in a conference environment for \$29.95 per month. VoiceCafé provides similar services with a wide range of options that vary from packages with VoIP capability for five people at a time on a conference call to up to 500 in one conference call, all for a flat monthly fee. The prices vary depending upon what package you choose, and there are several. iVocalize offers VoIP along with Internet conferencing options like PowerPoint presentation capabilities and presentation recording for future playback. They also provide optional Unicode translation in thirteen languages. The most basic VoIP package begins at \$10.00 a month with a prices going up incrementally depending upon your needs and how many will be involved in your conference calls. It is obvious that conference calling as well as standard long distance calling will be changing greatly in the near future as VoIP changes the landscape of telephone service. "Land lines" for long distance calling will eventually become obsolete as broadband becomes more common and makes VoIP just as commonplace as any other type of telephone call. And with the greater portability of soft phone options built into laptops and the use of ATA phone adapters, the use of VoIP in the average home will arrive sooner rather than later. This article on the "How VoIP Works" reprinted with permission. Copyright © 2004-2005 Evaluseek Publishing. About the Author Lucy P. Roberts is a successful freelance writer providing practical information and advice for consumers and businesses about everything related to audio conferencing services and VoIP providers. Her numerous articles include tips for saving both time and money; product reviews and reports; and other valuable insights for persons searching the Internet for information about the history of the telephone and related topics. ...

The PTEN/Akt Pathway Dictates the Direct α V β 3-Dependent Growth-Inhibitory Action of an Active Fragment of Tumstatin

Related Articles

The PTEN/Akt Pathway Dictates the Direct α V β 3-Dependent Growth-Inhibitory Action of an Active Fragment of Tumstatin in Glioma Cells In vitro and In vivo.

Cancer Res. 2006 Dec 1;66(23):11331-11340

Authors: Kawaguchi T, Yamashita Y, Kanamori M, Endersby R, Bankiewicz KS, Baker SJ, Bergers G, Pieper RO

The collagen type IV cleavage fragment tumstatin and its active subfragments bind to integrin α (V) β (3) and inhibit activation of focal adhesion kinase, phosphoinositol-3 kinase, Akt, and mammalian target of rapamycin (mTOR) in what is thought to be an endothelial cell-specific manner. The resultant endothelial cell apoptosis accounts for the ability of tumstatin to function as an endogenous inhibitor of angiogenesis and an indirect suppressor of tumor growth. We hypothesized that the inability of tumstatin to directly suppress tumor cell growth might be the result of the constitutive activation of the Akt/mTOR pathway commonly seen in tumors. Consistent with this idea, several integrin α (V) β (3)-expressing glioma cell lines with PTEN mutations and high levels of phospho-Akt (pAkt) were unaffected by exposure to an active fragment of tumstatin (T3), whereas α (V) β (3)-expressing glioma cell lines with a functional PTEN/low levels of pAkt exhibited T3-induced growth suppression that could be bypassed by small interfering RNA-mediated suppression of PTEN, introduction of a constitutively expressed Akt, or introduction of the Akt and mTOR target eukaryotic translation initiation factor 4E. The direct tumor-suppressive actions of T3 were further shown in an α (V) β (3)-deficient in vivo mouse model in which T3, while unable to alter the tumstatin-insensitive vasculature contributed by the α (V) β (3)-deficient host, nonetheless suppressed the growth and proliferative index of i.c. implanted α (V) β (3)-expressing PTEN-proficient glioma cells. These results show that tumstatin, previously considered to be only an endogenous inhibitor of angiogenesis, also directly inhibits the growth of tumors in a manner dependent on Akt/mTOR activation. (Cancer Res 2006; 66(23): 11331-40).

Macro Scheduler Beta :: RE: Macro Scheduler 9.0 Beta (044) Available

Author: mtettmar

Posted: Thu Dec 07, 2006 12:23 pm (GMT 0)

Topic Replies: 32

Beta 09 Build 044 is now available from registered downloads.

Fixes/Changes since 043:

- Fixed issue with Run button on macro properties not showing Japanese translation correctly
- Increased length of Import button on macro properties
- Fixed Screen Capture tool option in Editor/Tools menu
- Fixed main form not appearing screen center on first run (top left corner was screen center)

Regards,

Marcus Tettmar

GoldenEye 007

GoldenEye 007 has been a huge success for Rareware, and it's easy to see why. More than a simple movie translation, this has earned its top-seller status on its own. Fans of Doom and Quake will recognize the first-person shooter perspective, but there the similarity ends. James Bond 007 has too much style to simply blast everything in sight and move to the next level. No, as 007, the player has a variety of different missions to perform, each with its own specific objectives. Each mission follows the film closely, and so James must use stealth and cunning as much as brute force. But if you see a Kalashnikov rifle lying around, by all means pick it up. Controls are easy to master, which is impressive considering the variety of actions the onscreen hero can perform. James can run and walk at variable speeds, duck, pivot, hide, attach mines to enemy helicopters, block doors from opening, and more. The optional auto-aim feature is especially nice. Of course, James Bond is proficient in a wide variety of weapons. You get to use them all, from the trusty Walther PPK (with silencer) to double sets of full-auto machine guns. The game's faithful tribute to the Bond legacy includes briefing dossiers on each mission, complete with wisecracks from Q and flirtatious comments from Moneypenny. And the 3-D representation of locations and characters from the movie is very impressive. The Rareware team spent time on the set with digital cameras, and it shows. One of the distinguishing features of the game is the outstanding artificial intelligence of the enemies. When attacked, squads will rush to hit the alarm. If they make it, reinforcements come running. Enemy soldiers respond to being shot or blown up with chilling realism. According to Rareware, there are over 30 different animation routines that come into play, depending on where the soldier is hit. For those who prefer the challenge of human opponents, there are six clever multiplayer modes where up to four players can shoot it out, as teams or solo agents. With excellent gameplay, intelligence, and style, GoldenEye 007 is a first-person shooter that'll keep you coming back for more. --Jeanne Uy Pros: Built-in save capability for up to 4 players Auto-aim feature helps novice players feel like a sharpshooter Rich, complex game world filled with detail and variety Great bonus missions Cons: Sometimes cinematic scenes for fulfilling mission objectives are a bit anticlimactic

Intraneews - Daily News Site for Linguists

Need for sign language interpreters outpacing supply

Minnesota, USA (MPR): The Minnesota Disability Law Center is trying to get counties to provide sign language interpreters one lawsuit at a time. Last May the center sued Morrison County for failing to provide an interpreter for a deaf man in jail and in court. The case settled. In August, the center was able to force five St. Cloud area driving schools to provide sign language interpreters. The need for sign language interpreters is outpacing supply.

Universal language

New York, USA (DSC): What do dog barks have in common with bird tweets and human baby cries? All appear to communicate basic emotions, such as fear, aggression and submission, in somewhat the same acoustic way, according to a new Applied Animal Behavior Science study that suggests a primitive communication system may unite virtually all mammals. The theory could help explain why previous research has found that many mammals, including humans, understand the vocalizations of different species.

Translation Memories Survey 2006

London, UK (BCS): Elina Lagoudaki of Imperial College, London, is to give a talk about the Translation Memories Survey 2006. The British Computer Society Natural Language Translation Specialist Group is a forum to promote the automation of translation between natural languages through arranging talks, demonstrations and conferences, writing computer programs and publishing information with the goal of lowering linguistic barriers between nations.

Report: Arabic skills a key weakness in U.S.

Texas, USA (AAS): Despite efforts in the last few years to increase the number of Arabic speakers in the nation's defense and intelligence agencies, the Iraq Study Group's report released Wednesday carried a sobering fact: Of the 1,000 staff serving in the U.S. Embassy in Baghdad, only 33 speak Arabic and only 6 of those fluently.

Translation part of Iraq solution

Washington, USA (NY Times): The following excerpt is from a classified Nov. 6 memorandum that former Defense Secretary Donald H. Rumsfeld sent to the White House suggesting new options in Iraq. "Initiate a reverse embeds program, like the Korean Katusas, by putting one or more Iraqi soldiers with every U.S. and possibly Coalition squad, to improve our units' language capabilities and cultural awareness and to give the Iraqis experience and training with professional U.S. troops."

Lyric Labs launches tele-interpretation service in more than 140 languages

Amsterdam, Netherlands (PressZoom): Lyric Labs will specialize in providing telephonic interpretation services to call centers and other select industries. It specializes in rare languages and supports more than 140 languages. In situations where the client might not know what language that they need, the staff is trained to help determine the language required, and then connect the client with the appropriate interpreter. Many of the interpreters are state and federally certified and are members of interpreter organizations.
